The surprising fact is that over fifty species of mammals live in the territory, including some rare and precious ones, like Eurasian Otter and Chinese Pangolin, which can still be found in some protected areas of Hong Kong.. Short-nosed Fruit Bat and Common Red-stem Fig Some small mammals may also act as effective seed dispersers as they store seeds for later consumption.. As a result, many species that had flourished in Hong Kong began to die out Fortunately, certain species were able to adapt to these changes.

Some of these plants bloom at night, using special odors or flower shapes to attract bats.. These include the wild relative of economically important crops such as bananas and mangos.. Therefore, they are more likely to deposit the seeds in more illuminated areas or deforested areas.. Bats have been shown to be important seed dispersers of at least three species of local figs, Common Yellow Stem-fig, Opposite-leaved Fig and Common Red-stem Fig.. However, agriculture and urbanization depleted the natural habitats Huge forest trees were gradually logged or burned, and some large mammals such as South China Tiger were hunted as they were considered dangerous or man-eaters.

There is no doubt that mammals have a great impact on the ecosystem as they utilize many types of food and occupy various habitats at almost all latitudes.. While birds commonly defecate seeds from branches on the edges of forested areas, fruit bats often do so while flying in the open.. The ripe figs of these bat-dispersed species are green or yellow, do not attract birds and are available year-round.. Steam api dll f scott >> >> HK Species Terrestrial Mammals of Hong Kong Introduction It is thought that Hong Kong was part of a great tropical broad-leave forest with abundant elephants, tigers, wild red dogs, and a wide variety of tropical species about three thousand years ago.. Fruit bats have important roles as pollen or seed dispersers too More than 300 plant species rely on bats for survival.. Besides, most mammals are nocturnal and avoid humans, so they are seldom seen by casual observers and their presence is likely to be overlooked.. A single bat can catch hundreds of insects in an hour and large colonies of bats catch tons of insects in a single evening, including species of beetles and moths that are agricultural pests.
